SUMMARY

Co-Founder & Engineering Lead at Seekrr, a live location-based mobile platform shipped on Android. Engineer with a background in backend systems, AI platforms, distributed architectures, and reliable, scalable services—experienced in building event-driven systems, optimizing APIs and databases, and improving performance across microservices and data pipelines at Jio Platforms and Newfold Digital. Google Summer of Code alumnus and open-source contributor at The Linux Foundation, building meaningful engineering solutions end to end.

EDUCATION

Bachelor of Technology in Electrical Engineering
Indian Institute of Technology, Mandi

Sep 2019 – May 2023
Mandi, Himachal Pradesh

SKILLS

- **Languages & Backend:** Java (Spring Boot, REST APIs), Python, C/C++, JavaScript, TypeScript, Bash, microservices
- **Cloud & Infra:** Oracle Cloud Infrastructure (OCI), AWS, Azure, Docker, Linux, GitHub Actions, CI/CD
- **Data & Stores:** PostgreSQL, Cassandra, Redis, Elasticsearch, StarRocks, SQL
- **Monitoring & SRE:** Grafana, Prometheus, OCI Monitoring, ELK (Elasticsearch, Logstash, Kibana), SLI/SLOs, alerting
- **ML & GenAI:** NumPy, pandas, scikit-learn, PyTorch, TensorFlow, LLMs, RAG, LangChain tool orchestration, prompt engineering

EXPERIENCE

Co-Founder & Engineering Lead — Seekrr (Location-Based Quest Discovery Platform)
Seekrr ([Website](#), [Play Store](#))

Oct 2025 – Present
Jaipur, Rajasthan

- Co-founded Seekrr and lead end-to-end engineering for a mobile platform (**Flutter**, live on **Android**) that turns cities into interactive, map-based quest and exploration experiences.
- Architected real-time geospatial systems—live GPS tracking, proximity-based quest discovery, and QR-driven challenge validation—built on Mapbox and a location-streaming pipeline for users on the move.
- Designed and built backend APIs and data models for quests, user progress, and personalized discovery, integrating Firebase, Cloudinary media delivery, and an offline-first local store.
- Owned the full product lifecycle from architecture and **CI/CD** to store release, shipping multiple production versions to Google Play.

Software Developer — HAL Platform (Multi Region Orchestrator)
Newfold Digital

Mar 2025 – Oct 2025
Mumbai, Maharashtra

- Implemented an event-driven deployment pipeline using Kafka to coordinate deployments across regional clusters.
- Built high-throughput **Java services** powering real-time analytics APIs for the HAL platform, handling continuous event streams with strict latency budgets, schema evolution, and backward compatibility for downstream consumers.
- Built regional deployment agents that interact with Kubernetes APIs to execute deployments and report health metrics.
- Developed automatic rollback mechanisms based on Prometheus metrics and health checks to prevent production outages.

GET - Software Developer III — Push Magnum (High-Scale Backend Platform)
Jio Platforms Ltd.

Jun 2023 – Mar 2025
Bangalore, Karnataka

- Owned and evolved core **Spring Boot** microservices for the Push Magnum campaign platform, designing REST APIs for segmentation, personalization, and delivery orchestration that reliably served **millions of notifications per day** under variable traffic patterns.
- Implemented **Liquid Tags** enabling Campaign Management users to build personalized campaigns, driving engagement and reducing manual data-processing time.
- Implemented a **rate limiter** in the API controller that reduced server-overload incidents and delivered consistent, faster response times.
- Built a **Grafana dashboard** for key performance metrics, enabling the team to make data-driven decisions, and added mandatory security headers that closed multiple API vulnerabilities.

Google Summer of Code Developer — Core Printing Systems
The Linux Foundation

Jun 2022 – Oct 2022
Remote

- Implemented a production-grade **eSCL protocol parser in C** for the PAPPL printing framework, unlocking driverless scanning support for **100,000+ devices** across multiple Linux distributions and hardware vendors.
- Re-architected low-level protocol handling into strongly typed, validated object models that significantly reduced edge-case parsing failures and improved long-term maintainability.
- Built a comprehensive automated regression testing harness for PAPPL, Gutenprint, and LPrint eSCL flows, achieving **82% code coverage** and improving release confidence, with core protocol features accepted upstream against the **Mopria eSCL standard**.

LEADERSHIP & ACHIEVEMENTS

- Led a **10+ member** student panel at Canonical's OOS Conference 2023, coordinating agenda with open-source contributors.
- Headed a **10-member** corporate relations team for Xpecto'23, driving sponsorship outreach for the annual technical fest.
- Secured **1st place** in branch in URI Challenge (2020, 2021) and Codeniacs (2020, 2021); runner-up in **Vision Arcadia 2021**.
- Served as **Coordinator (2021–22)** for Robotronics Club, IIT Mandi and later **Mentor (2022–23)** guiding project teams on embedded systems and control logic.
